SUMMARY

Software engineer, five years in Python and backend-leaning full-stack. I build the systems behind AI video at Zebracat: job pipelines that split a render into work which can fail and retry on its own, the model steps that generate scripts and scenes, programmatic video with Remotion, and the React interfaces on top. I write publicly about how language-model systems behave under real traffic.

EXPERIENCE

Software Engineer · AI

SEP 2024 - PRESENT · REMOTE (BERLIN)

Zebracat · Generative text-to-video platform

- Build the generation pipeline: a render is split into jobs that retry independently across RabbitMQ workers, with state held per job so one failed step doesn't cost the whole video.
- Work on the model side of the product — script and scene generation, output validated against a schema before it reaches the pipeline, and retries that keep one bad response from failing a render.
- Build programmatic video with Remotion: React components rendered headlessly into frames, so changing a template ships like any other code change.
- Work across the stack — Django and FastAPI services behind React and TypeScript surfaces.

Python · FastAPI · Django · RabbitMQ · Redis · React · TypeScript · Remotion · Docker · AWS

Full-Stack Developer

JUN 2021 - SEP 2024 · REMOTE

Freelance · SaaS and consumer web products

- Shipped products end to end for clients: data model, API, frontend, deployment, and the support afterwards.
- Standardised on Django/DRF and FastAPI behind React, containerised, with monitoring in place before handover.
- Owned the parts a client couldn't audit for themselves — authentication, access control, and how their data was stored.

Django · DRF · FastAPI · React · PostgreSQL · Docker · Nginx

SELECTED OPEN SOURCE

229 stars across 23 public repositories · github.com/mohamad-liyaghi

FoodAnywhere 40 stars — Food-delivery backend. PostGIS geospatial search, Celery for slow work, and tracing that follows an order from request to worker.

fast-commerce 22 stars — Async e-commerce backend built for throughput — clean API boundaries, background processing, tests that gate deploys.

AcademyMaster 21 stars — Academy-management API with layered permissions and scheduled background jobs.

Tsuna-Streaming 16 stars — Streaming backend for video and music, with expensive processing pushed onto background workers.

telegram-to-rubika-uploader 14 stars — Go tool relaying files up to 2 GB directly between platforms, so nobody re-uploads over limited bandwidth.

FastQuora 11 stars — Q&A platform on FastAPI — Elasticsearch search, Redis cache, distributed tracing through both.

SKILLS

LANGUAGES	Python, Go, TypeScript, SQL, Bash
BACKEND	Django, Django REST Framework, FastAPI, Celery, RabbitMQ, asyncio, REST, WebSockets
MODELS	LLM APIs, structured output, tool calling, RAG, vector search, evaluation
DATA	PostgreSQL (incl. PostGIS), Redis, Elasticsearch, MongoDB
FRONTEND	React, TypeScript, Tailwind, Remotion
INFRASTRUCTURE	Docker, Kubernetes, GitHub Actions, AWS, Nginx
RELIABILITY	OpenTelemetry, Prometheus, Grafana, Sentry, Pytest

WRITING

Long-form notes on language models in production, published on Medium — Stop Being a Feature Factory (Aug 2026), How an Agent Squad Actually Works (Aug 2026), How Model Routing Actually Works (Jul 2026). Full archive: medium.com/@el_mohamad

EDUCATION & LANGUAGES

EDUCATION	B.Sc. Computer Science
LANGUAGES	Persian — native · English — professional working proficiency
